

# Heliophysics Data API (HAPI)

Bob Weigel, Jon Vandegriff, Jeremy Faden,  
D. Aaron Roberts, Todd King, Nand Lal, Bobby Candey,  
Bernie Harris, Larry Brown, and Sandy Antunes

## Overview

- HAPI is a HTTP API specification designed primarily for streaming time series data, from simple scalars to N-dimensional spectrograms with time-varying bins.
- Main entry point <https://hapi-server/>

## Overview

- Active development since 2017. Specification is mature as are clients and servers and other software tools.
- The specification was developed by software engineers who have developed similar services and scientists who use and/or have developed services.

## Motivation for Specification

In the Heliophysics community, the methods for how data providers expose data include:

- A. A FTP or HTTP directory of files (usually one day of data per file);
- B. A HTTP request that returns a web page with link to a file when processing is complete;
- C. A HTTP request that returns a web page with link to an archive of files (zip or tgz) when processing complete; and
- D. An API that returns a data stream.

Also note variations in implementation in each category, e.g., for A., providers may have different directory structures, file types, and file naming conventions.

# Motivation for Specification

Some data providers and the methods available include

1. **AMDA** [<http://amda.irap.omp.eu/service/hapi>] - B, D
2. CARISMA [<http://www.carisma.ca>] - C
3. **CCMC/iSWA** [<https://iswa.gsfc.nasa.gov/>] - D
4. **CDWeb** [<https://cdaweb.gsfc.nasa.gov/>] - A, B, D
5. CA/O [<https://csa.esac.esa.int/csa/aio/>] - C, D
6. **Das2** [<http://das2.org/>] - D
7. IMAGE [<http://space.fmi.fi/image>] - C
8. **INTERMAGNET** [<http://intermagnet.org>] - A, C
9. **LiSIRD** [<http://lasp.colorado.edu/lisird/>] - A, D
10. *MADRIGAL* [<https://openmadrigal.org/>] - A, D
11. **OMNIWeb** [<https://omniweb.gsfc.nasa.gov/>] - A, D
12. *PDS* [<https://pds-ppi.igpp.ucla.edu/hapi>]
13. **SSCWeb** [<https://sscweb.gsfc.nasa.gov/>] - D
14. *SuperMAG* [<http://supermag.jhuapl.edu/>] - D
15. **VirES-for-Swarm** [<https://vires.services/hapi>] - D

- A. A FTP or HTTP directory of files (usually one day of data per file);
- B. A HTTP request that returns a web page with link
- C. A HTTP request that returns a web page with link to zip or tgz
- D. An API that returns a data stream.

**Bold = HAPI available**

**Italic = HAPI under development**

**A single specification for method (streaming API) can be used to describe and serve data from all of these providers**

## Primary design considerations

1. Should be simple to write a basic HAPI server and client
2. Metadata should be just enough to create a plot with sensible scientific labels.

More detailed science-interpretation-level metadata (e.g., SPASE or provider web page) is pointed to in HAPI metadata.

## Facilitating Adoption

To facilitate adoption, in parallel to the development of the specification, we have developed

1. Clients for Autoplot, IDL, Java, Javascript, MATLAB, Python, R;
2. A web interface for selecting data from any HAPI server + plotting + script builder (<https://hapi-server.org/servers/>);
3. A server validator; and
4. A general-use servers (In Java and Javascript; only need to provide metadata + command line program that returns data); less generalized code for Python server exists.

Spec and full list of software at <https://github.com/hapi-server>

# Development

Known servers: <http://hapi-server.org/servers/>

Specification is at version 3.1 and is stable. For 3.1:

- Additions for case where frequency channels/bins change with time
- Allow for key that indicates the standard used for unit strings
- Allow for indicating coordinate system when appropriate
- Allow for embedding of external metadata
- Several groups are developing servers for simulation output; ongoing discussions on how to handle custom request parameters
- Active development of general servers

## Summary

- HAPI is a HTTP API specification designed primarily for streaming time series data, from simple scalars to N-dimensional spectrograms with time-varying bins.
- Data from many providers is available through HAPI software clients, and we continue to add to the list.

## Overview

The Heliophysics Data Application Programmer's Interface (HAPI) specification. When data are available from a HAPI server, there is no programs. Using a HAPI client library, data can be loaded into an array Python.

- Use this interface to
  - generate a [HAPI URL](#) to download data,
  - plot data from a HAPI server, and
  - generate [cURL](#) / [IDL](#) / [IDL SPEDAS](#) / [Javascript](#) / [MATLAB](#) plot the selected parameter.
- Begin by selecting a HAPI data server on the left or selecting an
- 12 servers available.

## Example Queries

- Plot [SYM-H timeseries](#) from [CDAWeb HAPI server](#)
- Plot [empire\\_tsi timeseries](#) from [LASP/LiSIRD HAPI server](#)

## API - Endpoints

<http://server/hapi/capabilities>

<http://server/hapi/catalog>

<http://server/hapi/info>

<http://server/hapi/data>

## API - Metadata

<http://server/hapi/capabilities>

Returns a list of transmission protocols supported (CSV, Binary, and JSON). A HAPI server only needs to support CSV.

Note that the data output is not meant to be a file format for exchange of data. It is a simple streaming format intended for use primarily by HAPI clients.

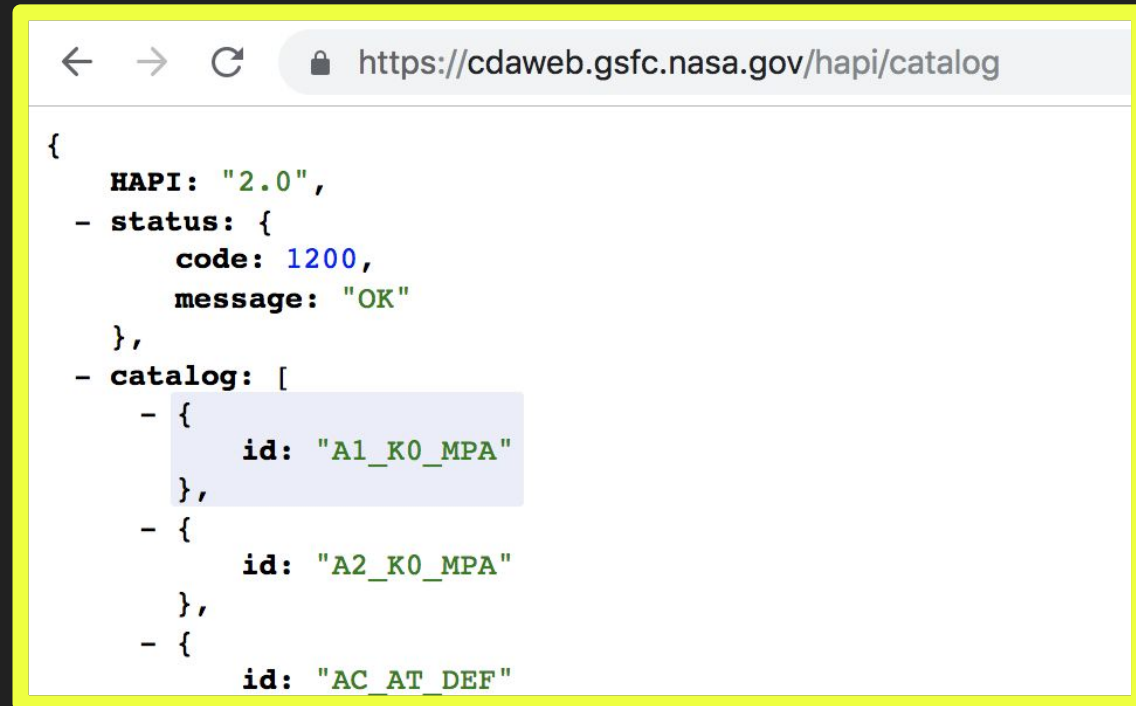

The optional binary format is simple and fast - essentially CSV with commas and newlines removed and numbers replaced with binary representation.

```
{
  HAPI: "2.0",
  - status: {
    code: 1200,
    message: "OK"
  },
  - outputFormats: [
    "csv",
    "binary",
    "json"
  ]
}
```

# API - Metadata

<http://server/hapi/catalog>

Returns a list of available datasets

A screenshot of a web browser window with a yellow border. The address bar shows the URL <https://cdaweb.gsfc.nasa.gov/hapi/catalog>. The main content area displays a JSON response from the API. The response is a root object with a 'HAPI' field set to '2.0', a 'status' field containing an object with 'code' 1200 and 'message' 'OK', and a 'catalog' field containing an array of three dataset objects. The first object in the array has an 'id' of 'A1\_K0\_MPA', the second has 'A2\_K0\_MPA', and the third has 'AC\_AT\_DEF'.

```
{
  HAPI: "2.0",
  - status: {
    code: 1200,
    message: "OK"
  },
  - catalog: [
    - {
      id: "A1_K0_MPA"
    },
    - {
      id: "A2_K0_MPA"
    },
    - {
      id: "AC_AT_DEF"
    }
  ]
}
```

# API - Metadata

<http://server/hapi/info?id=DATASET>

Returns info for all parameters in **DATASET**

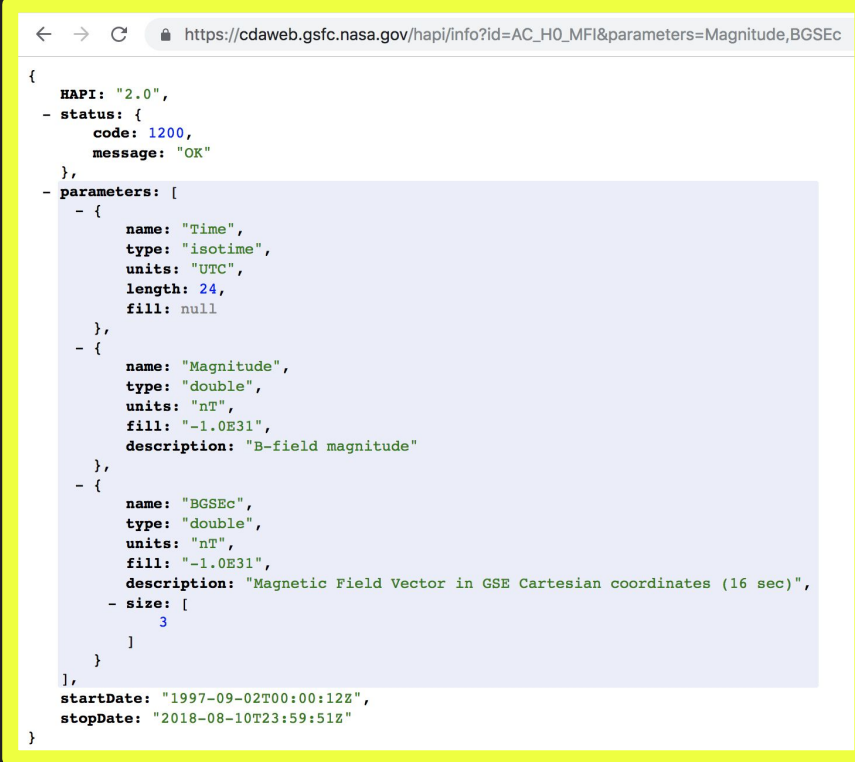

The screenshot shows a web browser window with the URL [https://cdaweb.gsfc.nasa.gov/hapi/info?id=AC\\_H0\\_MFI](https://cdaweb.gsfc.nasa.gov/hapi/info?id=AC_H0_MFI). The browser displays a JSON response from the HAPI metadata API. The response is a JSON object with the following structure:

```
{
  HAPI: "2.0",
  - status: {
    code: 1200,
    message: "OK"
  },
  - parameters: [
    - {
      name: "Time",
      type: "isotime",
      units: "UTC",
      length: 24,
      fill: null
    },
    - {
      name: "Magnitude",
      type: "double",
      units: "nT",
      fill: "-1.0E31",
      description: "B-field magnitude"
    },
    - {
      name: "BGSEc",
      type: "double",
      units: "nT",
      fill: "-1.0E31",
      description: "Magnetic Field Vector in GSE Cartesian coordinates (16 sec)",
      - size: [
        3
      ]
    }
  ]
}
```

# API - Metadata

`http://server/hapi/info?id=DATASET&parameters=P1,P2,...`

Returns info for only requested parameters

```
{
  HAPI: "2.0",
  - status: {
    code: 1200,
    message: "OK"
  },
  - parameters: [
    - {
      name: "Time",
      type: "isotime",
      units: "UTC",
      length: 24,
      fill: null
    },
    - {
      name: "Magnitude",
      type: "double",
      units: "nT",
      fill: "-1.0E31",
      description: "B-field magnitude"
    },
    - {
      name: "BGSec",
      type: "double",
      units: "nT",
      fill: "-1.0E31",
      description: "Magnetic Field Vector in GSE Cartesian coordinates (16 sec)",
      - size: [
        3
      ]
    }
  ],
  startDate: "1997-09-02T00:00:12Z",
  stopDate: "2018-08-10T23:59:51Z"
}
```

# API - Data

hapi/data

?id=DATASET

&parameters=P1, P2, ...

&start=ISO8601\*

&stop=ISO8601\*

[&format={csv, json, binary}]

*If not given, all parameters served*

*\*Constrained ISO8601 timestamp*

*\*Constrained ISO8601 timestamp*

*Server only needs to support format=csv.*

Default output is a CSV table for parameters P1, P2, ... (parameters can be multidimensional - client uses metadata to reshape associated columns).
